

Supplementary Material 1: Mean (\bar{x}), standard deviation (SD) and range (Min., Max.) of the water parameters at the three study sites with different level of degradation (Vohimarina, D1= low; Andreba, D2= intermediate; Anororo, D3= high). Presented are data measured within the vegetation during the rainy season (surface water and deep water) determined during four periods a day: 7000–1000h, 1000–1300h, 1300–1600h and 1600–1900h. Asterisks shown with the values of the surface water indicate statistical significant differences between surface water of sampled marsh vegetation and open water (n= 112, Table 1). Asterisks presented with the values of the deep water indicate statistical significant differences between deep water of sampled marsh vegetation and open water (n= 112) (significance level: $p \leq 0.05 = *$, $p \leq 0.01 = **$, $p \leq 0.001 = ***$).
